The present invention describes an isolated anti-CD33 antibody or its epitope-binding fragment comprising: (a) at least one complementarity-determining region (CDR); or (b) at least heavy chain variable region comprising 3 CDRs, and at least one light chain variable region, where the CDR has the ability to bind CD33. Also described: (1) an immunoconjugate comprising the antibody or its epitope-binding fragment linked to a drug or prodrug; (2) a composition comprising the antibody or epitope-binding fragment and a drug or prodrug; (3) a pharmaceutical

New antibodies that bind to CD33, useful for treating a disease associated with CD33 expression, such as myelodysplastic syndrome, acute

The present invention describes an isolated anti-CD33 antibody or its epitope-binding fragment comprising: (a) at least one complementarity—determining region (CDR), or (b) at least heavy chain variable region. GDR, and at least one light chain variable region, where the CDR has the ability to bind CD33. Also described: (1) an immunocollygate comprising the antibody or its epitope-binding fragment and a drug or prodrug; (2) a composition comprising the antibody or prodrug in comprising the antibody or prodrug in a pharmaceutical composition comprising the immunocollygate, composition of the antibody or attibody fragment is labelled; (5) inhibiting the where the antibody or antibody fragment is labelled; (5) inhibiting the approach of antibody or attibody fragment is labelled; (5) inhibiting the where the antibody or attibody fragment is labelled; (5) inhibiting the contains a myelogenous cancer cell; (7) an improved antibody or its epitope-binding fragment, immunoconjugate, or contains a myelogenous cancer cell; (7) an improved antibody or its epitope-binding fragment that specifically binds to CD3; (8) an isolated polynucleotide encoding the antibody or its epitope-binding fragment (10) are recombinant vector comprising the polynucleotide, (11) a host cell cransformed with the recombinant vector; (12) producing an antibody or its epitope-binding fragment having the ability to bind CD33; and (13) cobtaining fragment that specifically binds to bind CD33; and (13) cobtaining fragment having the ability to bind CD33; and (13) cobtaining fragment having the ability to bind cD33; and coptaining fragment coptaining fragment having the ability to bind cD33; and coptaining fragment having the ability to bind cD33; and coptaining fragment having the sused for transiting a subject having a immunoconjugate, composition can be used for transiting a subject having a coptaining fragment can be used for the present or in vivo imaging or as affinity purification agents. The present continued and an expense or an expense or an Example 3; SEQ ID NO 73; 124pp; English. or chronic myeloid leukemia. Sequence 117 AA; invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes an isolated anni-tube antipody or its epitope-binding fragment comprising: (a) at least one complementarity-determining region (CDR); or (b) at least heavy chain variable region comprising 3 CDRs, and at least one light chain variable region comprising 3 CDRs, and at least one light chain variable region, where the CDR has the ability to bind CD33. Also described: (1) an immunoconjugate comprising the antibody or is producing; (2) a composition comprising the antibody or producing (3) a pharmaceutical composition comprising the immunoconjugate, composition or the natibody or antibody or antibody fragment is labelled; (3) inhibiting the defined above, or its epitope-binding fragment; (4) a diagnostic reagen comprising the antibody of a cell expressing CD33 by contacting the cell with the above defined antibody or its epitope-binding fragment; (1) immunoconjugate, or (pharmaceutical) composition; (6) determining whether a biological sample contains a myelogenous cancer cell; (6) it (7) an improved antibody or its epitope-binding fragment that specifically binds to CD33; (8) an isolated polymucleotide encoding the antibody or its epitope-binding fragment; (10) carecombinant vector comprising the polymucleotide encoding a light or heavy care comprising the polymucleotide encoding a light or heavy contains of the antibody defined above or its epitope-binding fragment; (10) are secondinant vector comprising the polymucleotide encoding a subject having a creme with the recombinant vector; (12) producing an antibody or its epitope-binding fragment having the ability to bind CD33; and (13) cotaining CD33 from a biological material. The antibody we rette encompant or activity. The antibody or its epitope-binding antibody or its epitope-binding fragment having the ability to bind CD33; and (13) expressed, such as myelody place comprising to a subject having a cutivity. The antibody or its epitope-binding and encounted for in vivo imaging or as affinity purification agents. The present contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                New antibodies that bind to CD33, useful for treating a disease associated with CD33 expression, such as myelodysplastic syndrome, acute or chronic myeloid leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                                                                                         (MAb) or its antigen-binding fragment containing the complementarity determining regions (CDRs) of at least one murine anti-CD20 Mab variable region and the framework regions (FRs) of at least one human IV1AB variable region. The antibodies of the invention are useful for diagnosing or preventing B-cell lymphoma, leukaemia or an autoimmune disease (e.g. thrombocytopenia, lupus or rheumatoid arthritis). The present amino acid sequence represents a chimeric anti-CD20 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                           invention comprises a humanised anti-CD20 (hCD20)monoclonal antibody

                                                                                                                                                                                                                                                                                                   New humanized anti-CD20 monoclonal antibody (MAb) that retains substantially the B-cell and B-cell lymphoma and leukemia cell targeting of the murine anti-CD20 MAb, useful for treating B-cell lymphoma, leukemia or an autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                       (MAb) or its antigen-binding fragment containing the complementarity determining regions (CDRs) of at least one murine anti-CD20 Mab variable region and the framework regions (FRs) of at least one human IVIAB variable region. The antibodies of the invention are useful for diagnosing or preventing B-cell lymphoma, leukaemia or an autoimmune disease (e.g. thrombocytopenia, lupus or rheumatoid archiritis). The present amino acid sequence represents a chimeric anti-CD20 antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               humanised anti-CD20 monoclonal antibody; hCD20 monoclonal antibody; MAb; IV1AB variable region; B-cell lymphoma; leukaemia; autoimmune disease; thrombocytopenia; lupus; rheumatoid arthritis;
                                                                                                                                                                                                                                                                                                                                                                              invention comprises a humanised anti-CD20 (hCD20)monoclonal antibody

ABJ39009;

ABJ39009 standard; protein; 412 AA.

```
The present sequence represents a fusion of an anti-CD20 single chain antibody (BBE9) streptavidin. The fusion protein is expressed using vectors of the invention. The specification describes vector constructs for expressing streptavidin fusion proteins. The vector comprises a nucleic acid encoding streptavidin or its functional variant operatively incleic acid encoding streptavidin or its functional variant operatively uncleic acid sequence encoding a polypeptide to be fused with streptavidin, interposed between the promoter and the first nucleic acid sequence. Alternatively, the vector construct comprises a nucleic acid, sequence. Alternatively, the vector construct comprises a nucleic acid, operatively linked to a promoter, encoding a polypeptide to be fused with streptavidin, and a cloning site for insertion of a second nucleic acid encoding at least 129 amino acids of streptavidin tumour cells, particularly tumour cells associated with cancer, e.g. adenocarcinomas or hematological malignancies. The vector construct is useful for expressing for medical diagnostics and therapeutic purposes, e.g. for detecting the presence or absence of, or treating, a target site within a mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New vector constructs for expressing genomic streptavidin fusion proteins which are useful for targeting tumor cells associated with cancer, e.g.

This invention relates to novel vector constructs for the expression of streptavidin fusion proteins. Streptavidin (SA) is produced by Streptavidin fusion proteins. Streptavidin (SA) is produced by streptomyces avidinil and specifically binds water-soluble biotin. The vectors comprise a nucleic acid sequence encoding genomic streptavidin, a promoter operatively linked to the nucleic acid sequence and a cloning site for insertion of a second nucleic acid sequence encoding an anti-cD25 antibody or its antigen binding fragment. The fusion proteins encoded are known as single chain antibody-genomic streptavidin fusion conteins (SPCSA). The vectors may have cytostatic activity when used in gene therapy. The vectors may be useful in expressing genomic streptavidin fusion cassettes. The fusion proteins may be used as a reptavidin fusion cassettes. The fusion proteins may be used as treatment and the bBSB single chain antibody-genomic streptavidin fusion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a cell-free, in vitro method of remodeling a peptide. The method involves removing a saccharyl subunit from the peptide. The method involves removing a saccharyl subunit from the peptide, thus forming a truncated glycan, and contacting the truncated glycan, that least one glycosyl contact of the sast one glycosyl transferase and at least one glycosyl donor under conditions suitable to transfer at least one glycosyl donor to the truncated glycan, thus remodeling the peptide. Conjugates can be formed between a granulocyte colony stimulating factor (G-CSP) peptide, interferon alpha peptide, interferon beta peptide, Factor VIII peptide, interferon-gamma peptide, alpha-1-protease inhibitor (A-1-PI) peptide, interferon-gamma peptide, tissue plasminogen activator (TPA) peptide, interleukin-2 (IL-2) peptide, Pactor VIII peptide, TMFalpha receptor/immunoglobulin (Ig) G fusion peptide, urokinase peptide, anti-Glycoprotein IIb/IIIa monoclonal antibody peptide, chimeric anti-HER2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ဌ

```
Treating B cell lymphoma in humans, comprises administering immunologically active, chimeric anti-CD20 antibodies and/or radiolabeled
antibody peptide, anti-respiratory syncytial virus (RSV) F peptide, anti-CD20 antibody peptide, recombinant DNase peptide, anti-TNF alpha peptide, insulin peptide, hepatitis B surface antigen (HbsAg), human growth hormone (HGH) peptide, and a modifying group, where the modifying group is covalently attached to the peptide through an intact glycosyl linking group. The method is useful for a cell-free, in vitro method of remodeling the above mentioned peptides. The present sequence represents the murine anti-CD20 antibody heavy chain mature variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    NOKFKGKATLTADKSSTTAYMOLSSLTSEDSAVYYCAREVRLR---YFDVWGAGTTVTVS 117

The invention relates to an improved method for treating B cell lymphoma comprising administering an anti-CD20 antibody. The improvement comprises administering at least one chemotherapeutic agent. The antibody causes a substantial depletion of peripheral B cells. The antibody is chimeric anti-CD20 or C2B8. The method is useful for treating B cell lymphoma. This sequence represents a murine immunoglobulin heavy chain variable region used in the method of the invention.

The cells are used in the treatment and prevention of cancer and immune disorders. This sequence corresponds to a protein used in the method of the invention.

               administering, at a second administration period, a radiolabelled anti-
CD20 antibody, to the human subject. The invention also discloses
expression vectors that may be used in the method of the present
invention. The method is useful for treating B cell lymphoma in humans.
The present sequence represents murine anti-CD20 antibody heavy chain
variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fc-bound sugar chains of low fucose immune disorders.
immunologically active, mouse/human chimeric anti-CD20 antibody and/or

The invention relates to a drug containing as the active ingredient, an antibody composition produced by cells tolerant to a lectin recognising a gugar-chain structure in which an alpha-bond is formed between the 6-position of N-acetylglucosamine at the reducing end of an N-glycoside bond-type complex sugar chain and the 1-position of fucose. The drugs are useful in screening and treating patients not suitable for drugs not derived from these cells. They are particularly useful as diagnostics, preventives or remedies for diseases accompanying tumour, allergy or inflammation, autoimmune diseases diseases of the circulatory system, and viral or bacterial infections. In a method from the invention, a CCR4 gene was used for constructing a vector (CAG-CCR4/pcDNA3) for producing a transformant EL-4 cell (ATC TIB-39) to express chimeric CCR4. Antibody-dependent cytotoxicity of the thus produced antibody composition was confirmed. The current sequence represents a protein related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 NQKFKGKATLTADKSSTTAYMQLSSLTSEDSAVYYCAREVRLR---YFDVWGAGTTVTVS 117

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ή
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to cells with modified sugar chain modifying enzyme activity. The enzyme activity of binding the 1-position of fucose to the 6-position of an N-acety/glucosamine at the reducing end of a complex N-glycoside linked sugar chain via an alpha-bond is absent or less than in the parent cell. The sugar chain modifying enzyme is preferably alpha 1,6-fucosyltransferase (ADE73052-ADE73053 and ADE73055-ADE73055). The invention is useful for the treatment and prevention of tumours, allergy, inflammation, autoimmune disease, circulatory disorders, and viral and bacterial infection. The present sequence was used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     117

This invention relates to novel erythropoietin (EPO) peptides and the remodelling and glycoconjugation of these naturally occurring peptides thereof. Specifically, each EPO peptide comprises one or more glycans and has a glycoconjugate molecule such as polyethylene glycol (EEG) attached to it. Accordingly, the present invention provides glycobEqylated EPO peptides that have either monoantennary, biantennary or triantennary glycans covalently attached thereto. As such, these peptides are useful for the treatment of anaemia, and hence exhibit antianaemic activities working to increase haematocrit levels in mammals, in particular in erythrocytes. Furthermore, EPO therapy can be used to treat kidney dialysis patients. This polypeptide is a human protein sequence related to the field of haematology, given in an exemplification of the

-I- MISCELLANEOUS: This protein binds dextran.
-I- SIMILARITY: Contains 1 1g-like (immunoglobulin-like) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schilling J., Clevinger B., Davie J.M., Hood L., are staid sequence of homogeneous antibodies to dextran and DNA rearrangements in heavy chain V-region gene segments.", Nature 283:35-40(1980)

Biochemistry 21:5415-5424(1982).
-!- MISCELLANEOUS: The sequence of the light chain of this IgM myeloma protein has also been determined.
-!- MISCELLANEOUS: This protein binds dextran.
-!- SIMILARITY: Contains I Ig-like (immunoglobulin-like) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 QVQLQQPGAEVVKPGASVKMSCKASGYTFTSYYIHWIKQTPGQGLEWVGVIYPGNDDISY

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7, At Sequence 7, At Sequence 4, At Sequence 44, A Sequence 41, At Sequence 11, At Sequence 18, A Sequence 12, A Sequence 18, A Sequence 12, A Sequ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 11,

Sequence 73, Application US/10700632

Sequence 73, Application Wo. US20050118183A1

Sequence 73, Application No. US20050118183A1

GENERAL INFORMATION:

APPLICANT: ImmunoGen, Inc.

TITLE OF INVENTION: ANTI-CD33 ANTIBODIES AND METHODS FOR TREATMENT OF ACUTE MYELOID

TITLE OF INVENTION: LEUKEMIA USING THE SAME

TITLE OF INVENTION: US/10/700,632

CURRENT APPLICATION NUMBER: US/0/24,332

CURRENT APPLICATION NUMBER: US 60/424,332

PRIOR APPLICATION NUMBER: US 60/424,332

PRIOR PRILING DATE: 2002-11-07

NUMBER: OF SEQ ID NOS: 94

SEQ ID NO 73
